

VIBRATORY BULK STORAGE HOPPERS

Used to automatically load parts into a bowl feeder, giving large storage capacities and providing several hours running time. The hoppers can also be used to trickle-feed awkward components (i.e. components that easily tangle) into bowl feeders, therefore increasing feed rates and efficiency from the feeder. These units are best applied when the bowl feeder is situated at a comparatively low level.

ELEVATING HOPPER LOADER

Used to load heavy (or where appropriate light) parts to bowl feeders that because of design layout parameters are situated at a high level. The storage bin is floor mounted and therefore at a low convenient level for refilling. The storage bin can be either static or driven by vibration or a conveyor belt and these options are selected according to the components handling characteristics.
